1. Introduction

1.1 Background

Cool Planet Fashion Store sells clothing products in different styles and sizes. For customers to find the items they want, the required sizes need to be available on shop-floor displays. In the scenario for this project, the existing inventory system records warehouse stock but does not adequately monitor the availability of each size on the shop-floor display. As a result, a size may be available in the warehouse while missing from the display.

1.2 Purpose of the document

The purpose of this Business Requirements Document (BRD) is to explain what Cool Planet Fashion Store needs from the proposed Automated Display Size Availability and Replenishment Notification System. It describes the main business needs and the features the system should provide. This document will help the technical team understand what needs to be developed and will be used to plan the development, review the requirements with stakeholders, and test whether the system meets the business needs.

1.3 Business Objectives

- Make it easier for employees to check the availability of clothing items on shop-floor displays by product and size.
- Reduce the need for employees to check stock manually to find out which items need replenishment.
- Help staff quickly identify clothing sizes that are running low or are no longer available on display.
- Send notifications to the supervisors when items need to be restocked.
- Keep stock records accurate when clothing items are moved from the warehouse to the shop-floor display.
- Improve the shopping experience for customers and help managers make better decisions by providing useful information about stock availability and replenishment activities.

2. Business Requirements

The proposed Display Size Availability and Replenishment Notification System aims to improve customer satisfaction at Cool Planet Fashion Store. The following business requirements describe the main improvements the business expects from the proposed solution.

ID	Business Requirement	Priority	Expected Outcome
BR-01	Improve display stock visibility by product and size.	Must Have	Supervisor can identify display quantities for each product and size.
BR-02	Provide visibility of warehouse and display stock together.	Must Have	Supervisor can determine whether a missing display size is available in the warehouse.
BR-03	Help staff identify low or empty display stock promptly.	Must Have	Low/empty display stock is identified using an agreed threshold.
BR-04	Notify supervisors when replenishment is required.	Must Have	Relevant employees receive an alert containing useful stock details.
BR-05	Improve assignment and tracking of replenishment tasks.	Must Have	Tasks can be assigned and their progress monitored.
BR-06	Maintain accurate stock records after confirmed transfers.	Must Have	Warehouse and display quantities are updated consistently.
BR-07	Provide management visibility of replenishment performance.	Should Have	Managers can review alert and replenishment information.
BR-08	Protect stock information and prevent unauthorized changes.	Must Have	System actions are restricted according to user permissions.

2.2 Expected Business Benefits

- Improved customer experience because required sizes may be easier to find.
- Reduced manual effort in identifying display replenishment needs.
- Better visibility of warehouse and display stock.
- More timely response to low display stock.
- Improved monitoring of replenishment activities by supervisors and managers.
- Potential reduction in missed sales when a size is in the warehouse but not displayed.

2.3 Business Success Criteria

The business can assess the system using measures such as the time taken to identify low display stock, the proportion of alerts handled within an agreed period, accuracy of stock records, completion of replenishment tasks and employee feedback. Numerical targets should be agreed with stakeholders before implementation.

3. Functional Requirements

Functional requirements describe the actions and services the system must provide.

ID	Functional Requirement	Priority
FR-01	Record display stock quantities by product and size.	Must Have
FR-02	Retrieve or receive warehouse stock information from the existing inventory source.	Must Have
FR-03	Display warehouse and display quantities together for each product and size.	Must Have
FR-04	Allow authorized users to configure display stock thresholds.	Must Have

FR-05	Identify display quantities at or below the configured threshold.	Must Have
FR-06	Generate a notification when replenishment is required.	Must Have
FR-07	Show product ID/name, size, display quantity, warehouse quantity, time and alert status in the notification.	Must Have
FR-08	Allow staff to check whether sufficient warehouse stock is available for replenishment.	Must Have
FR-09	Allow supervisors to assign replenishment tasks to authorized employees.	Must Have
FR-10	Record the confirmed quantity transferred from warehouse to display.	Must Have
FR-11	After a confirmed transfer, decrease warehouse stock and increase display stock by the same quantity exactly once.	Must Have
FR-12	Allow authorized employees to acknowledge alerts.	Should Have
FR-13	Restrict system functions according to user roles and permissions.	Must Have

4. Non-Functional Requirements

Non-functional requirements describe the quality, performance and operating standards expected of the system. The measurable targets below are proposed for discussion and require stakeholder and technical approval.

ID	Quality Area	Requirement	Priority
NFR-01	Performance	95% of normal screen requests should complete within 3 seconds under an agreed normal workload.	Should Have
NFR-02	Alert timeliness	95% of alerts should be generated within 60 seconds after a qualifying stock update has been processed.	Should Have
NFR-03	Usability	The interface should be understandable and usable by trained store employees.	Must Have
NFR-04	Reliability	The same confirmed stock transfer must not be applied more than once.	Must Have
NFR-05	Security	Role-based permissions must protect stock updates and administrative functions.	Must Have
NFR-06	Auditability	Important actions should record the user, date/time, action and relevant quantities.	Must Have

NFR-07	Data integrity	Product, size, quantity and transfer information must be validated and consistent.	Must Have
NFR-09	Maintainability	Technical and user documentation must be provided.	Should Have
NFR-10	Compatibility	The system must work with the agreed inventory interface, devices and supported browsers.	Must Have
NFR-11	Recovery	The interface should be understandable and usable by trained store employees.	Should Have
NFR-12	Scalability	The same confirmed stock transfer must not be applied more than once.	Should Have

Note: These targets are proposals, not confirmed company commitments. The relevant stakeholders and technical team should agree on realistic targets before the requirements are finalized.

5. Prioritization

prioritization groups requirements according to their importance. It helps the team focus on essential features for the initial release.

Category	Meaning	Example for This Project
Must Have	Essential requirements needed for the system's main purpose.	FR-01 to FR-11 and FR-13; core stock visibility, alerts, task tracking and accurate transfer updates.
Should Have	Important requirements that can follow after essential functionality, if necessary.	FR-12; alert acknowledgement, history and basic reports.
Could Have	Useful improvements that may be added if time and budget permit.	Enhanced user-friendly screens, dashboard charts and trend analysis.
Won't Have in Initial Release	Features excluded from the first release.	Automatic supplier ordering, robotic replenishment and replacement of the entire inventory system.

The Must Have requirements should be addressed first. The final priorities should be reviewed with stakeholders because business value, cost, time and technical dependencies may affect the implementation order

6. Requirements Traceability Matrix

The Requirements Traceability Matrix connects business requirements with the functional requirements that support them and identifies evidence that can be used to verify them. This helps the team check that each business need is covered.

Business Req.ID	Business Requirement	Related Functional Req.	Verification Evidence
BR-01	Improve display stock visibility.	FR-01, FR-03	Check that quantities are recorded and displayed by product and size.
BR-02	Show warehouse and display stock together.	FR-02, FR-03, FR-07	Compare displayed quantities with the approved stock source.
BR-03	Identify low or empty display stock.	FR-04, FR-05	Test quantities above, equal to and below the configured threshold.
BR-04	Notify staff when replenishment is required.	FR-06, FR-07	Check alert creation, details and acknowledgement.
BR-06	Maintain accurate stock after transfers.	FR-11, FR-12	Confirm a transfer and verify both stock quantities update correctly.
BR-07	Improve management visibility.	FR-12, FR-13	Review alert history and replenishment reports.
BR-08	Protect stock information.	FR-13	Test permitted and prohibited actions for different user roles.

6.1 Example Acceptance Checks

Test ID	Test Scenario	Expected Result
TC-01	Display = 0, warehouse = 8, threshold = 2.	A low-stock alert is generated.
TC-02	Display = 1, threshold = 2.	The system identifies a replenishment need.
TC-03	Display = 0, warehouse = 0.	The system shows no warehouse stock and the task cannot be fulfilled normally.
TC-05	Unauthorized user attempts a stock update.	The system rejects the action.
TC-06	The same transfer confirmation is submitted twice.	The transfer is applied only once.

7. Conclusion

This Business Requirements Document explains the main requirements for the proposed Automated Display Size Availability and Replenishment Notification System at Cool Planet Fashion Store. It describes the business needs, the functions the system should provide, the expected quality standards, the priorities of each requirement, and how the requirements will be checked.

The main purpose of the proposed system is to help employees check clothing sizes available on the shop floor, identify missing sizes quickly, and replenish items when needed. It will also help maintain accurate stock records and make daily stock management easier. This document will guide the technical team in developing the system. Before development starts, the requirements and expected performance levels should be reviewed and agreed upon by the relevant business and technical teams.
